Empowering Agriculture: Enhanced GHG Emissions Modeling

Team Introduction

Leveraging data science for a greener future

Team member

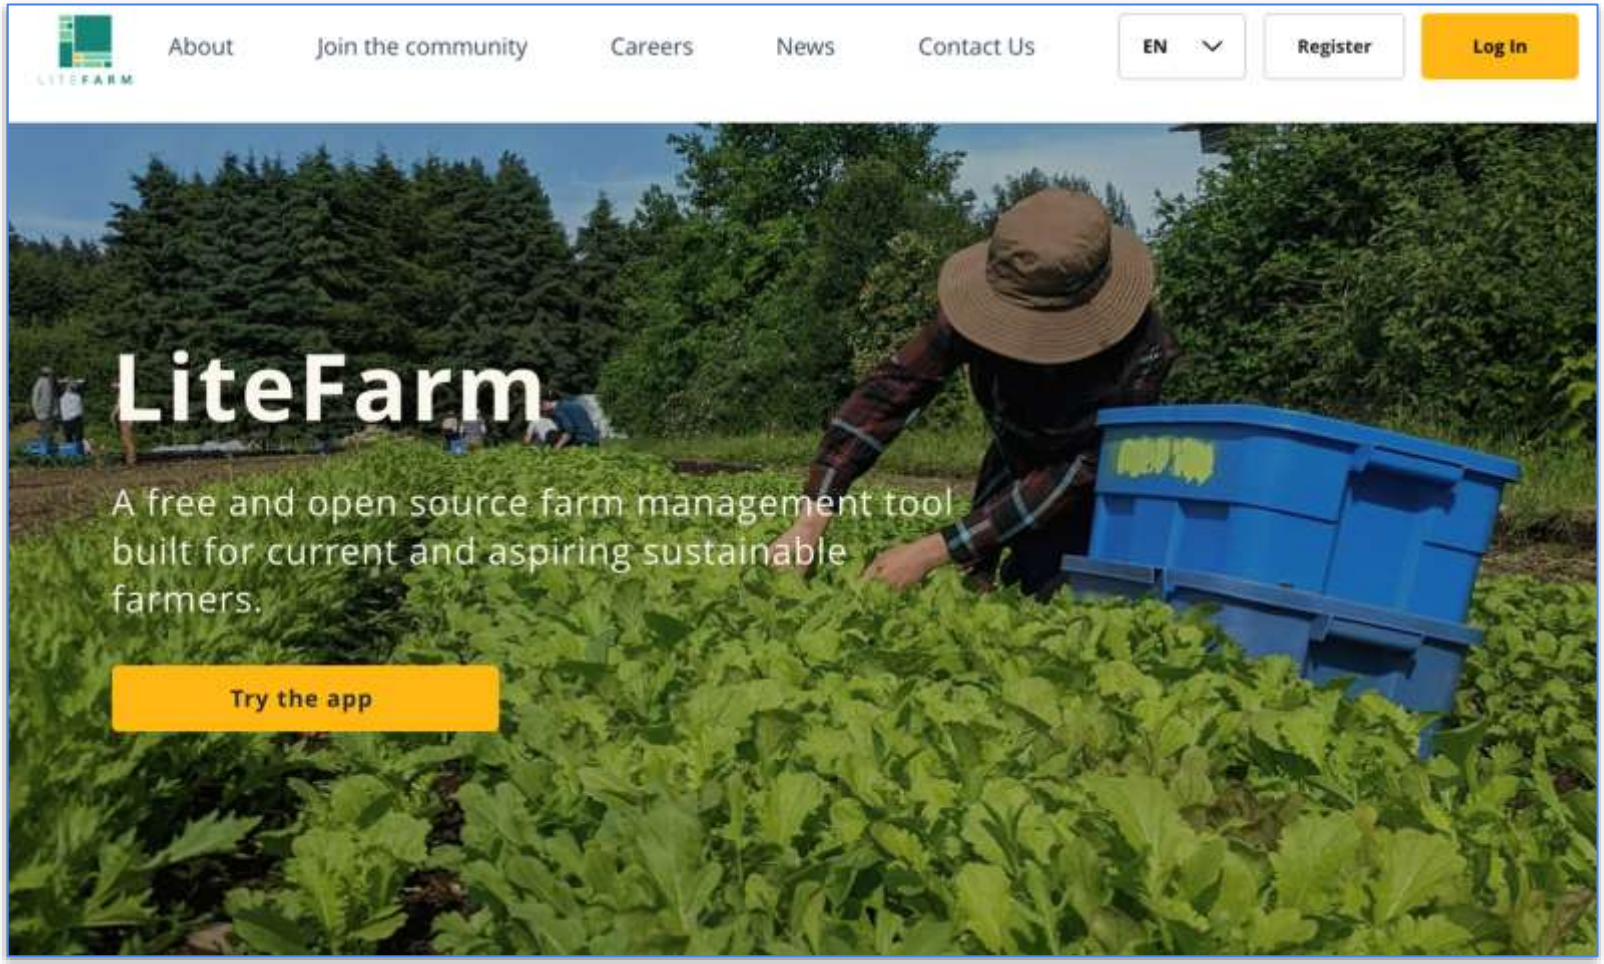
- He Ma
- Hancheng Qin
- Yi Han

Mentor

- Simon Goring

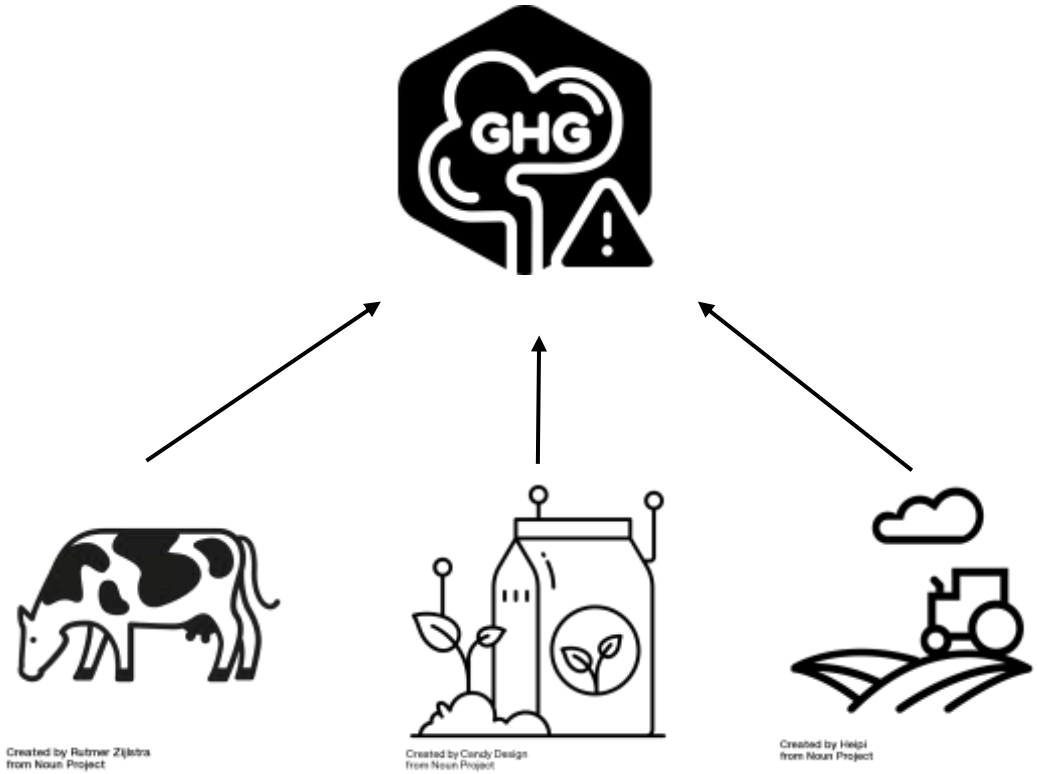
Partner

- LiteFarm/UBC
  - Dr. Khanh Dao Duc



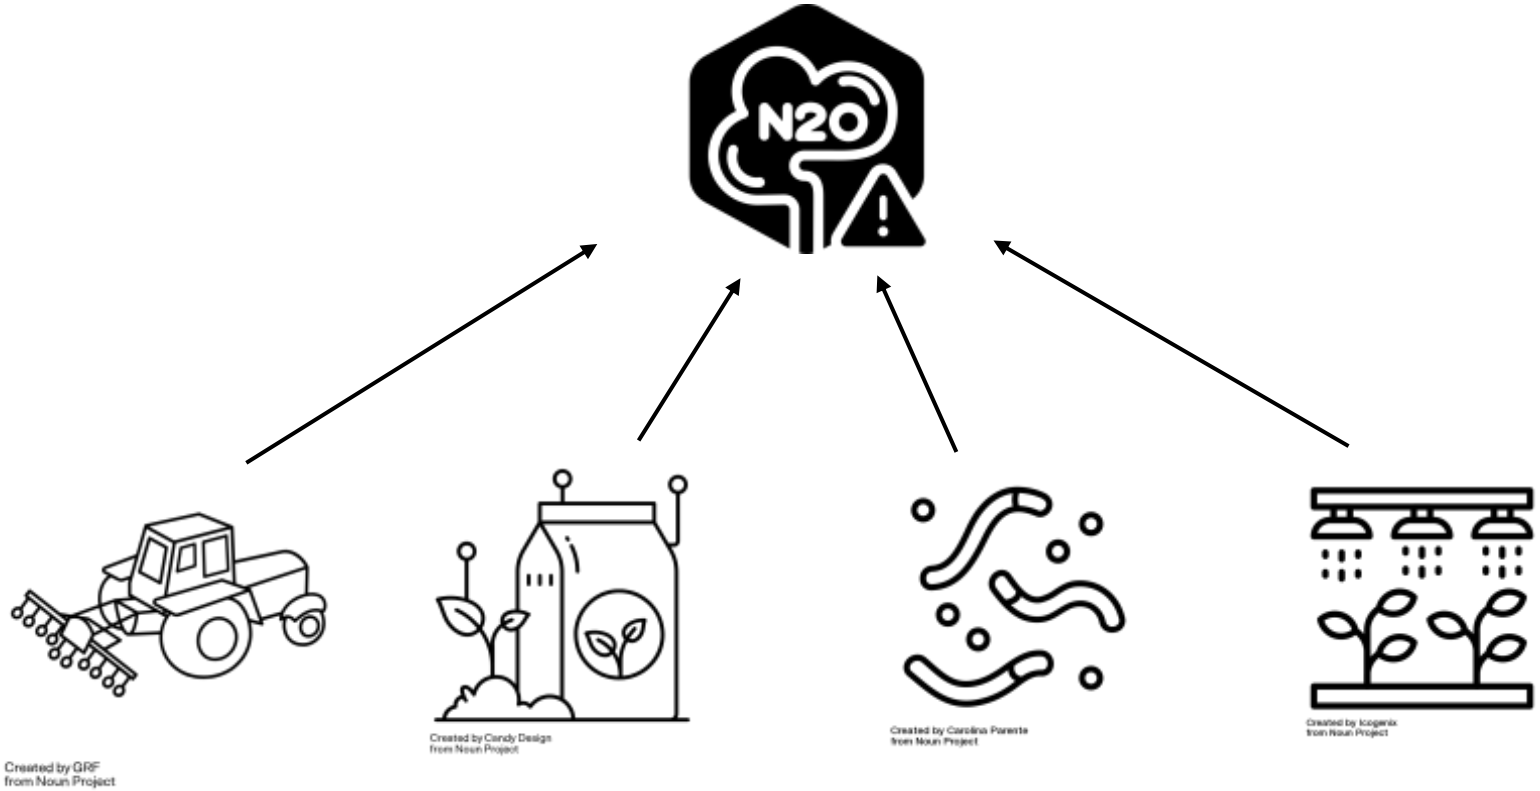
Climate Change and GHG Emissions

Agriculture as a significant player



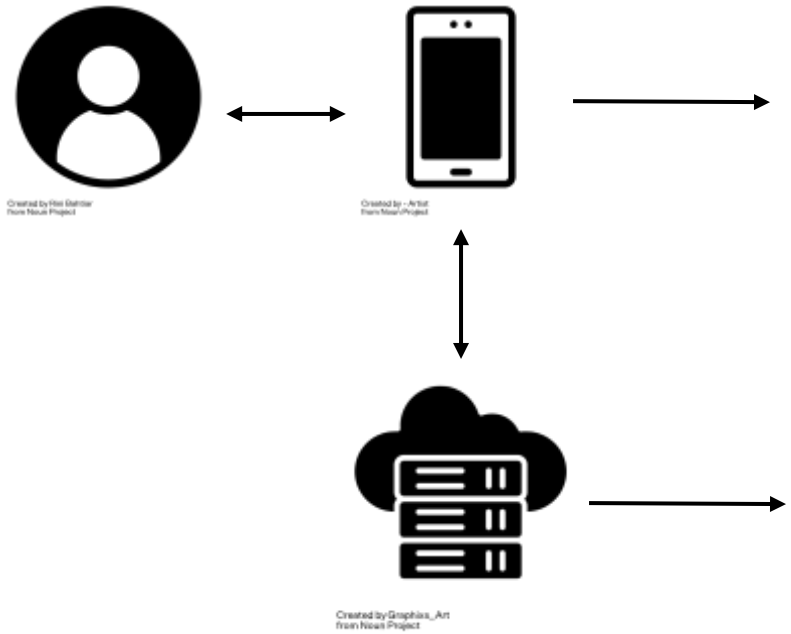
Climate Change and GHG Emissions

Agriculture as a significant player

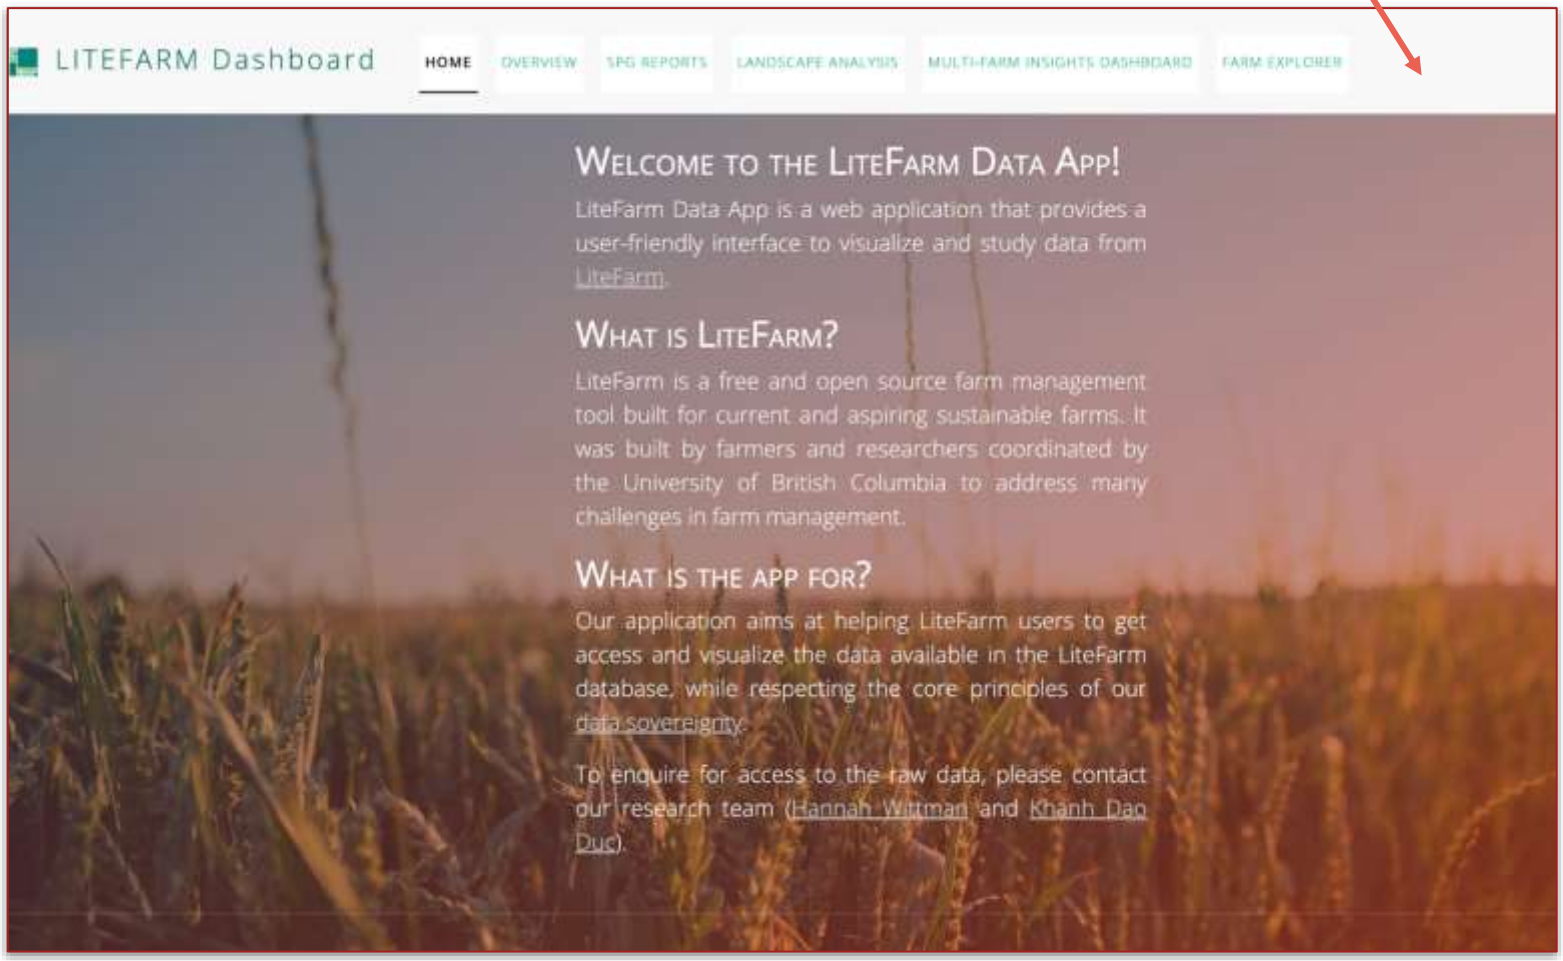


Sustainable Farming with LiteFarm

Calculating GHG Emissions: Our Critical Contribution

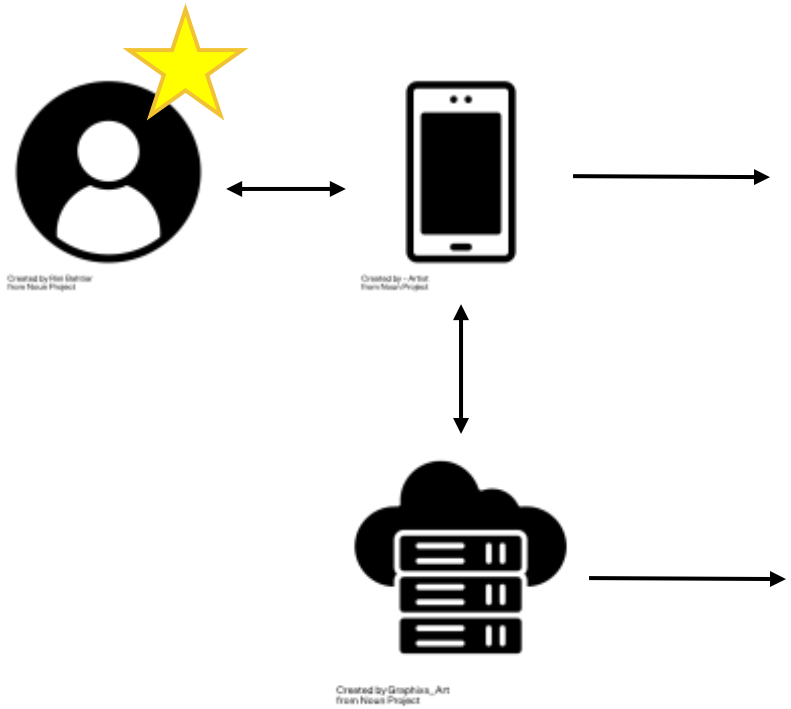


GHG Emissions

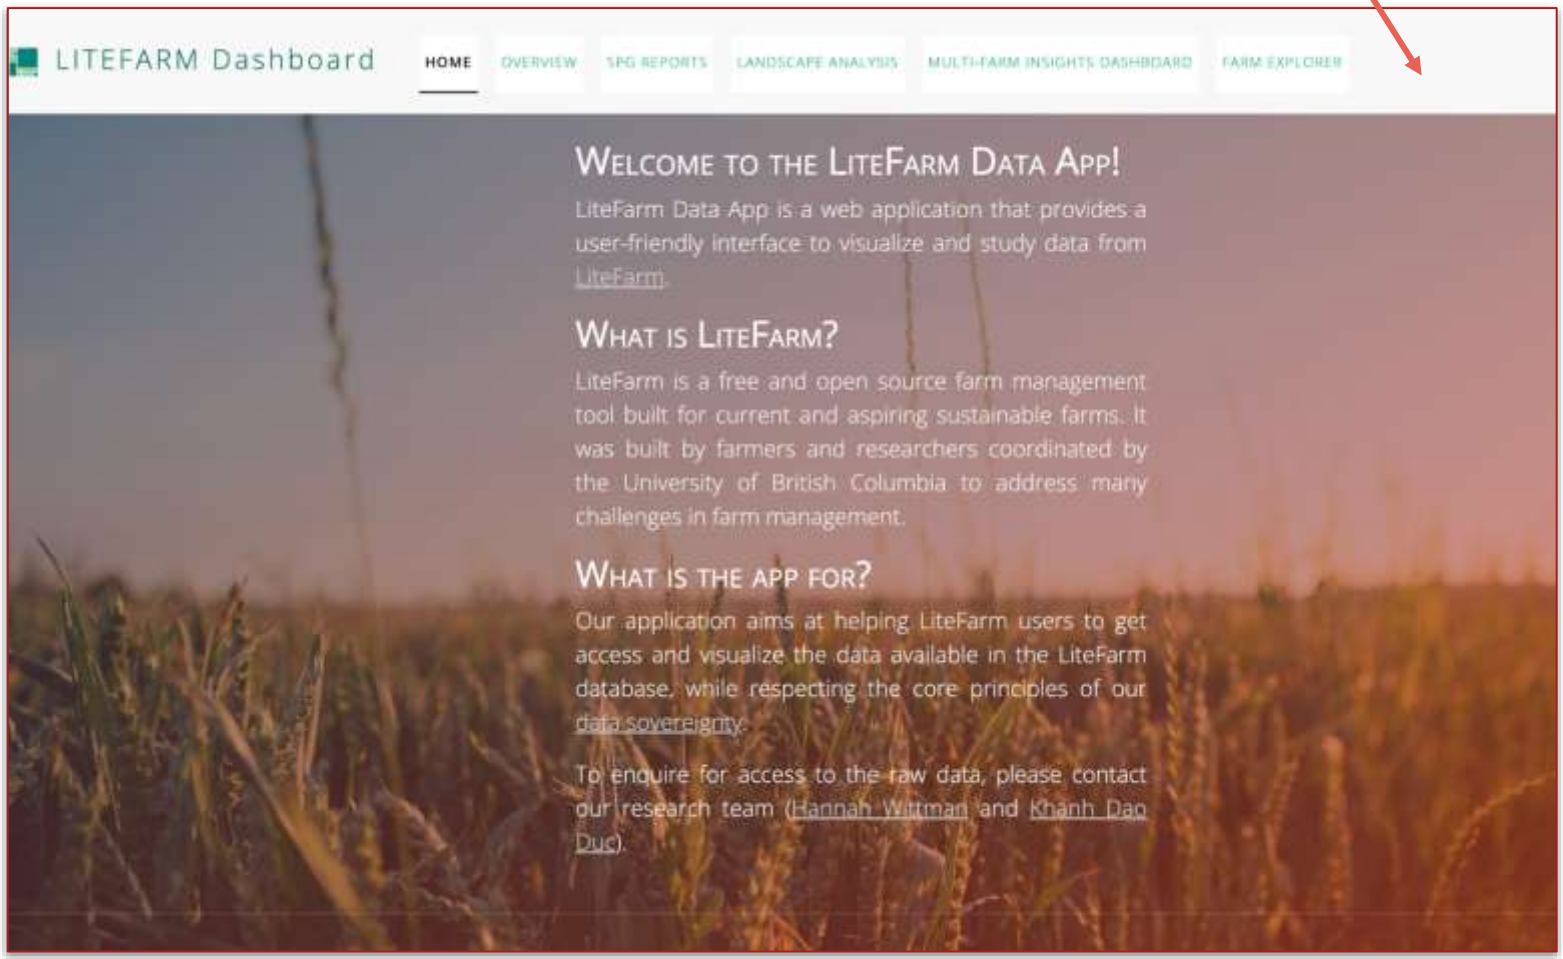


Sustainable Farming with LiteFarm

Main objective: Empowering farmers, researchers and policy-makers



GHG Emissions



Objectives

GHG Emissions Modeling

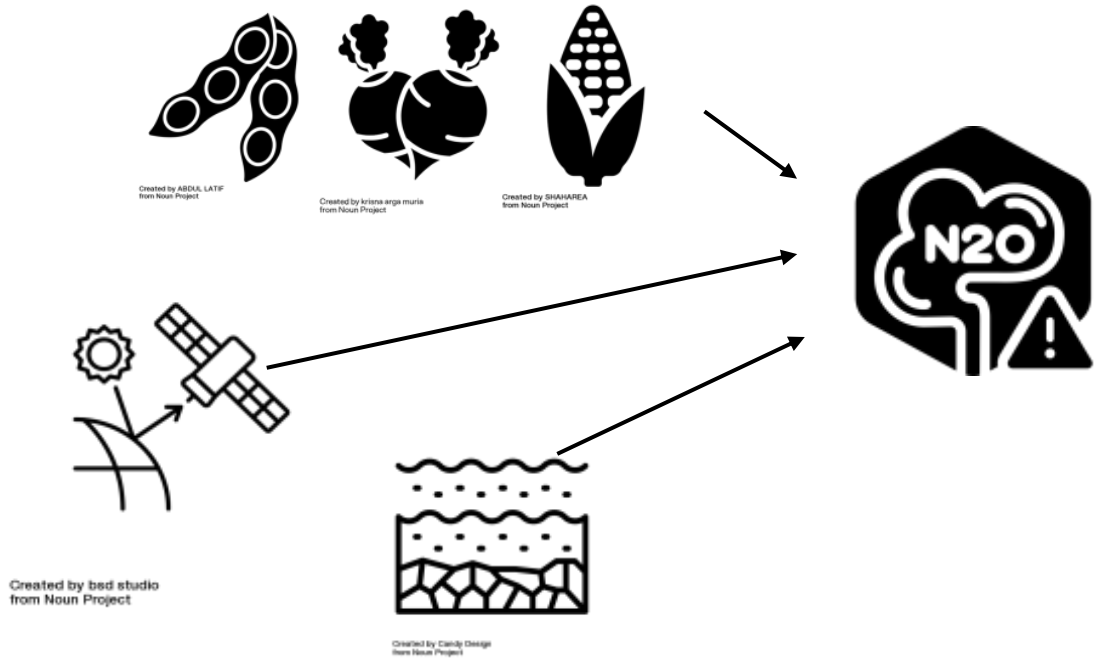
- **Confront existing models with high quality global scale data**

- **Enhance GHG Emission Modeling**

Objectives

GHG Emissions Modeling

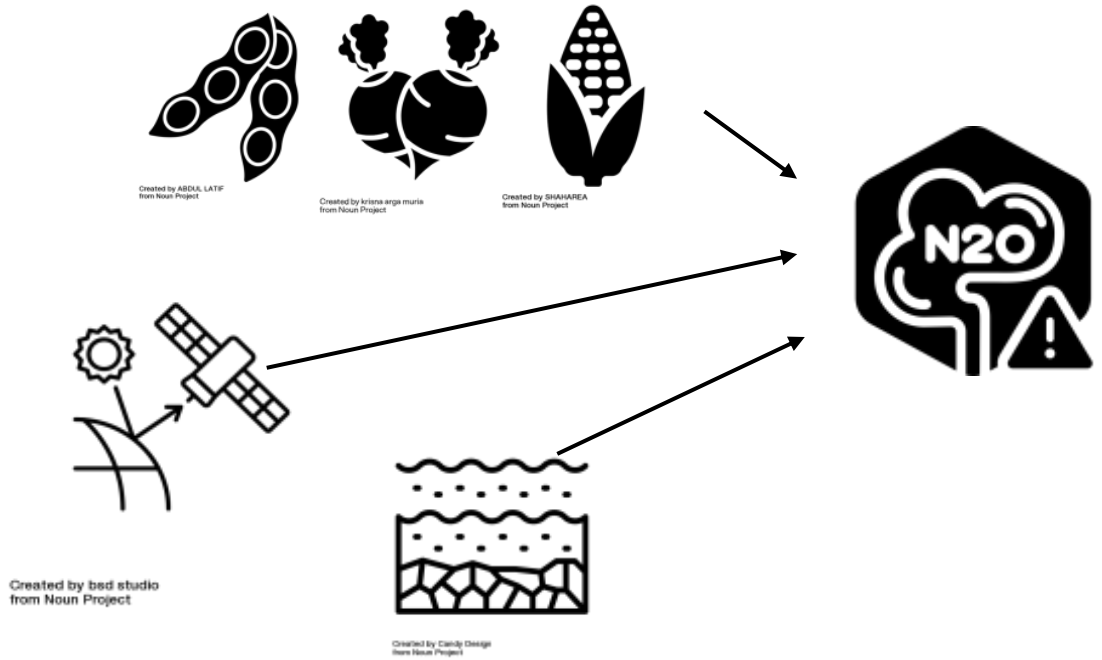
- **Confront existing models with high quality global scale data**
  - Soil
  - Climate
  - Crops
- **Enhance GHG Emission Modeling**



Objectives

GHG Emissions Modeling

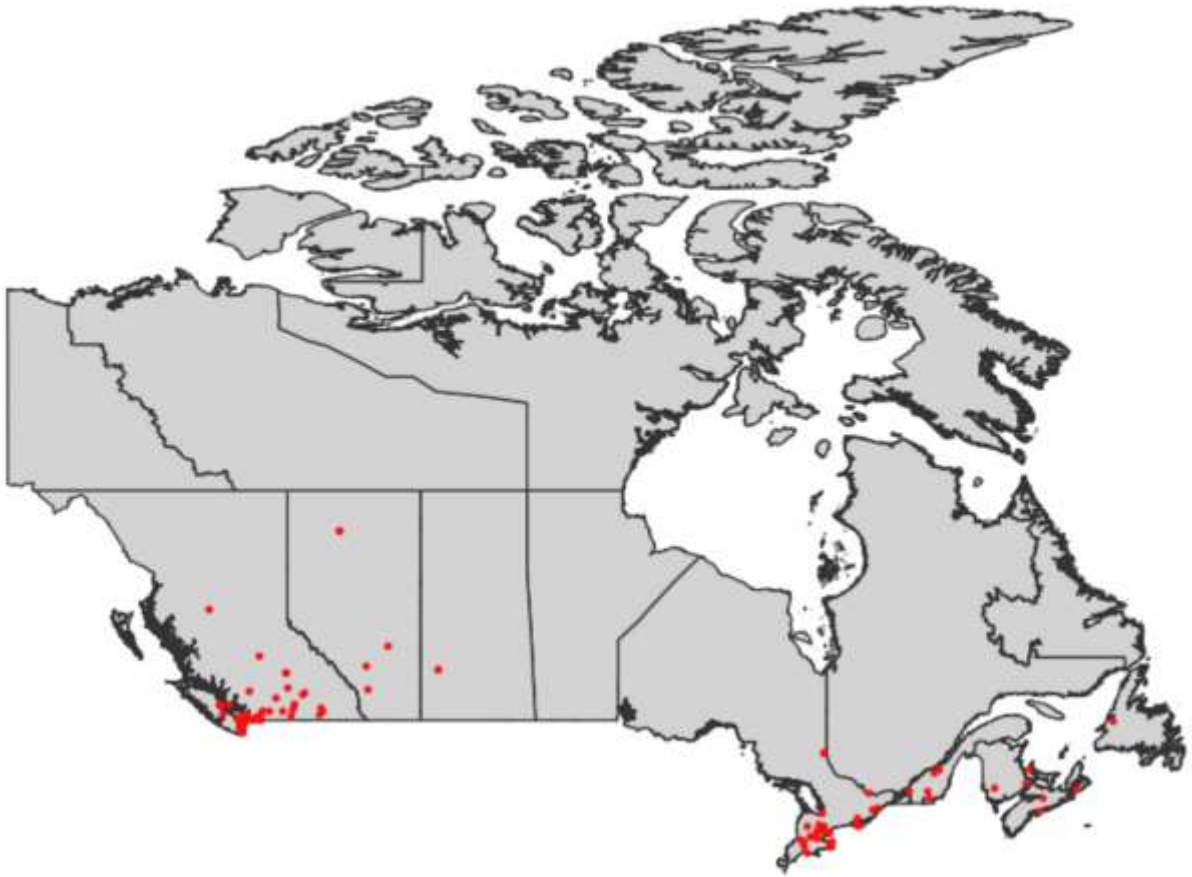
- **Confront existing models with high quality global scale data**



- **Enhance GHG Emission Modeling**
  - Investigating influencing parameters
  - Improving accuracy and robustness

LiteFarm Data

Farm Data



124 farms across Canada

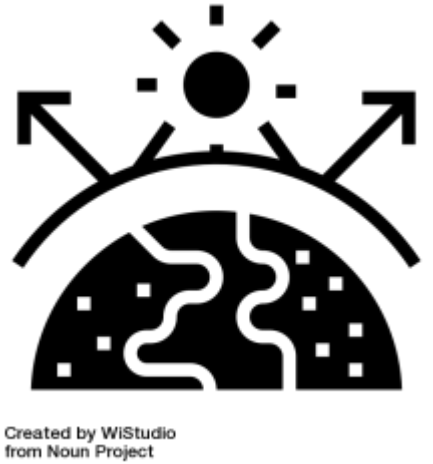
- Farm id
- Location: lat/lon
- Area
- Crop types
- …

LiteFarm Database

Soil Data
Soil texture
Great group
…

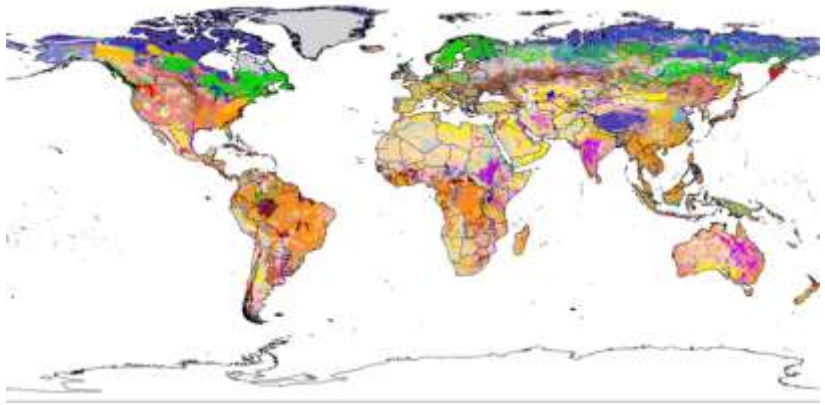
Climate Data
Precipitation
Evaporation
...

Crop Data
Moisture content of product
Nitrogen contents
Lifecycle
...



GHG Estimation

Sources of External Data

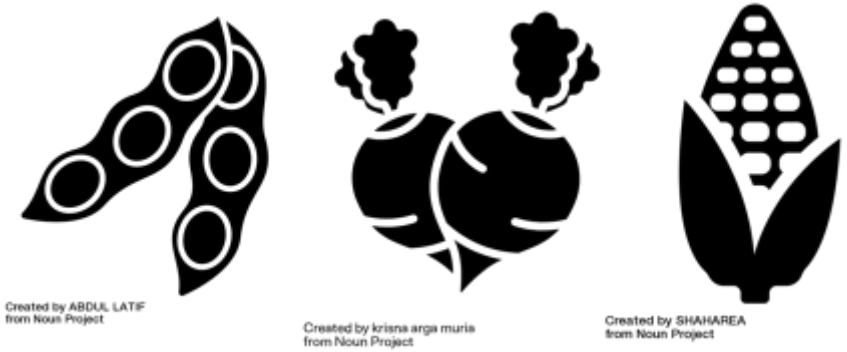


Soil data: FAO Harmonized World Soil Database

- open source
- can be downloaded

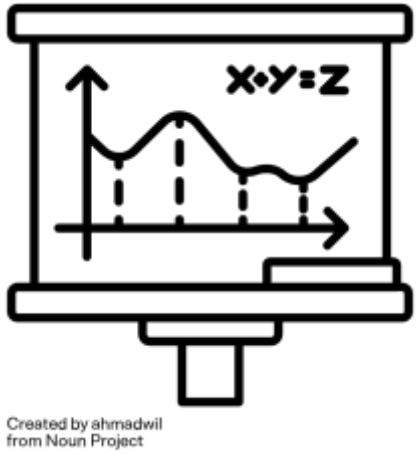
Soil data: The Soil Landscapes of Canada (SLC)

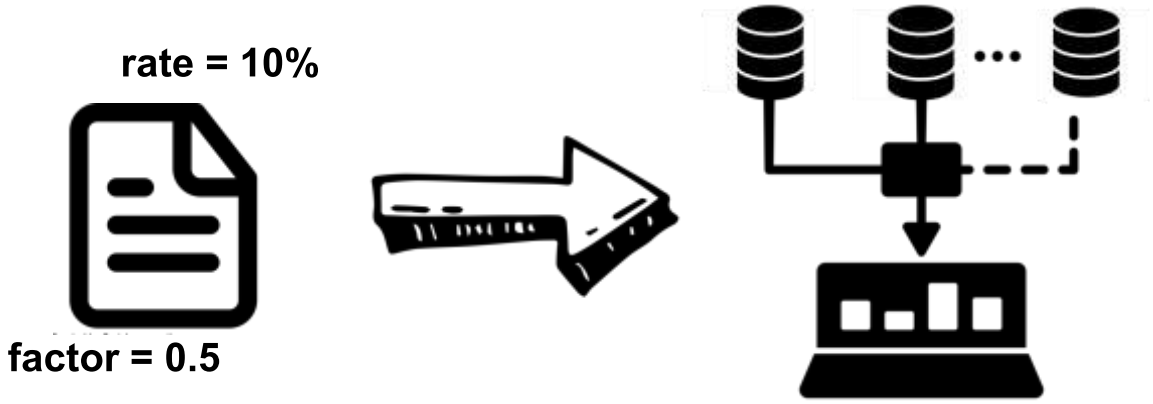
Climate data: NASA POWER Project database



Crop data: Peer-reviewed articles and government reports

Enhanced GHG Emissions Modeling





Identify and resolve discrepancies
Existing Models vs **Python Implementation**

Hard coding → **Adaptable datasets**
Improve accuracy / Influencing parameters

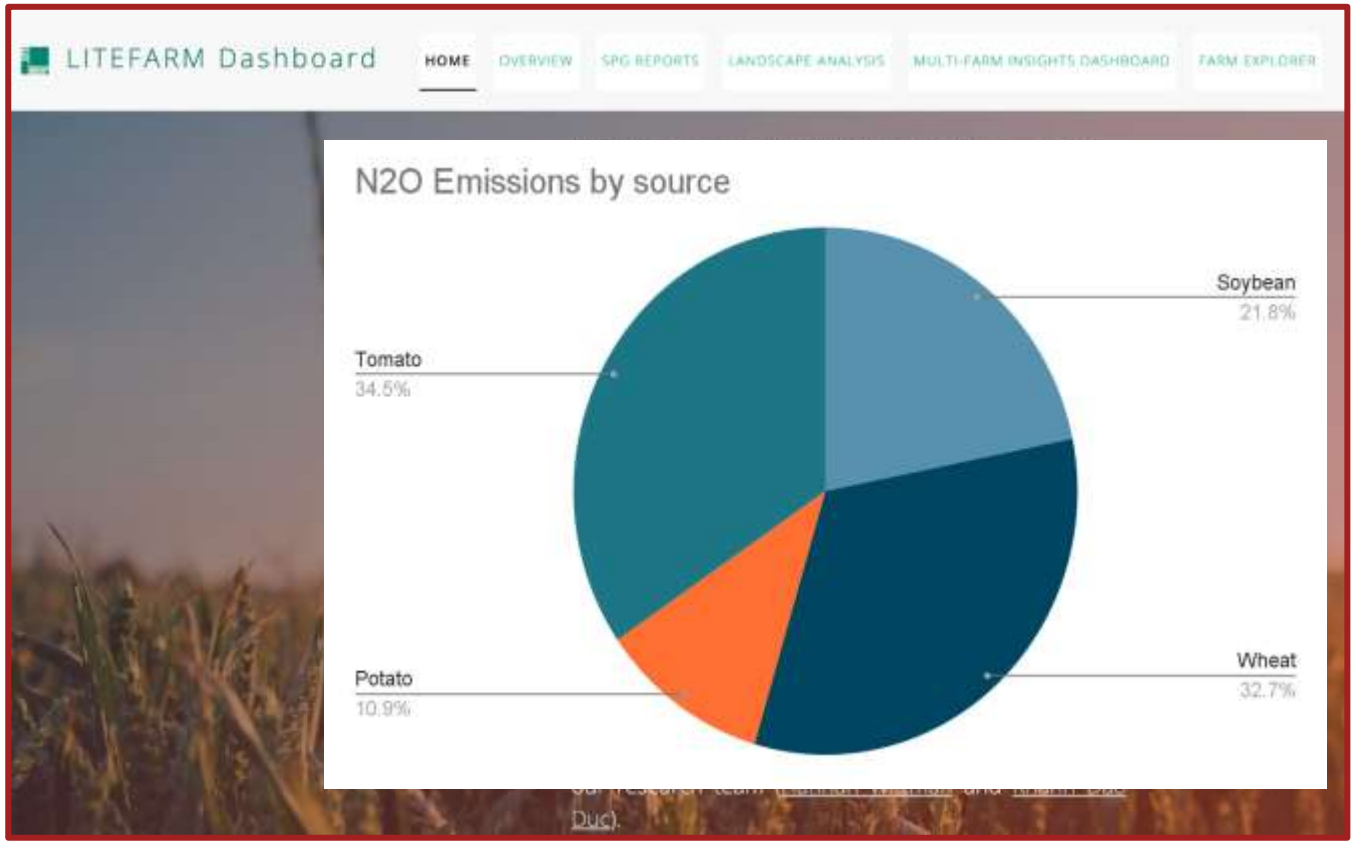
Method and techniques

GHG Model	**Validating the current model** **Developing and modularizing GHG calculation**
Sensitivity Analysis	**Multiple runs across farms / years, to identify key drivers of farm GHG emission**
Dashboard Design	**Two new tabs: Farmer tab for farm-specific emission data; Scientist tab for result from sensitivity analysis**

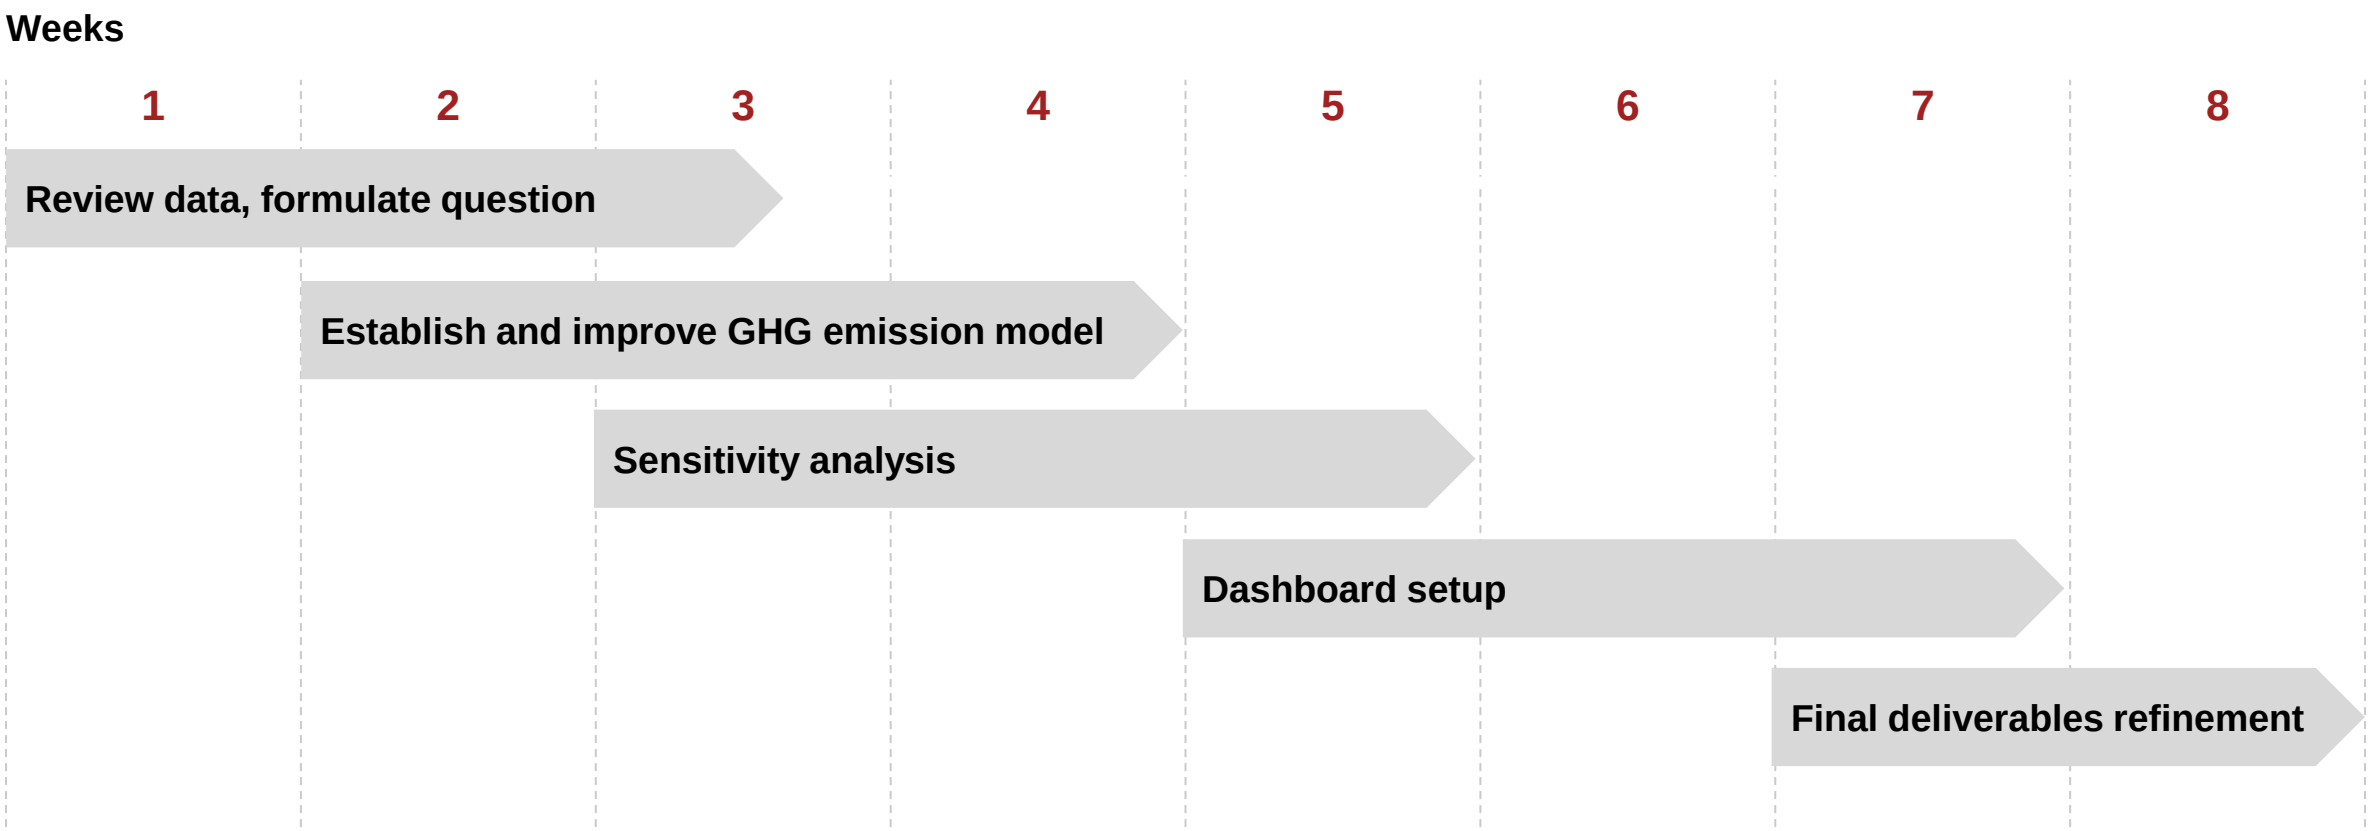
Success criteria

Success criteria

- Achieve a more precise GHG estimation model
- Allowing range input to provide more flexible calculation
- Provide output with uncertainty
- Establish Farmer and Scientist tabs on dashboard
- Implement new features with the results of sensitivity analysis and visualize influential variables for the GHG calculation



Timeline



Weeks
1
2
3
4
5
6
7
8
Review data, formulate question
Establish and improve GHG emission model
Sensitivity analysis
Dashboard setup
Final deliverables refinement
